You need a bgp.tools (free) + RIPE Atlas account for this

## Traceroutes/Looking Glass/Agents

## **Orange S.A.**

AS Number **5511** 

Select BGP Session to query:

London [IPv4] [IPv6]

Input Prefix:

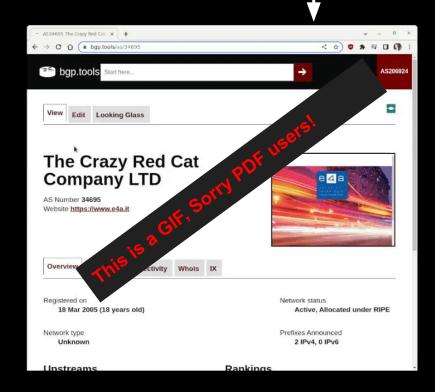

80.80.80.80

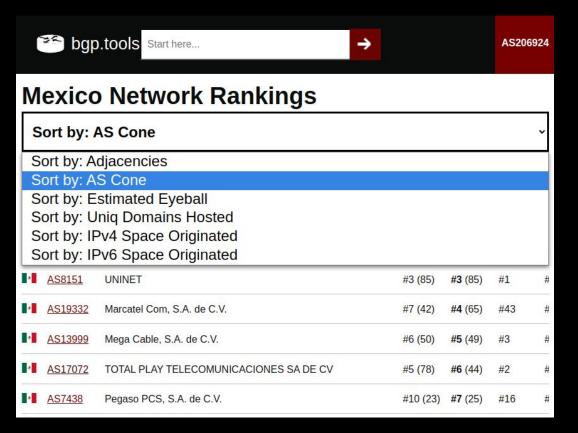

80.80.80.0/24 unicast [London 0000-00-00] \* (?/-) [AS60679]

BGP.as\_path: 5511 3356 30247 60679

BGP.community: [AS5511: United Kingdom] [AS5511: Route received from peering partner] [AS5511: Route received in Europe from peering] [AS5511: TUNE announce to US peers]

## **Network Ranking**

## Can be ranked by Global or ASN Country using:

- Peer Count (\*)
- AS Cone
- Eyeball Population
- Domain Records
- IPv4/IPv6 space originated

\* is improved by feeding bgp.tools BGP data

## Core points

- Bgp.tools was built out of the frustration I had with similar tools
- Practically realtime BGP data, updates fast enough to use as live feedback
- The horrors of WHOIS is handled, and in some cases is updated in near real time
- Most data is frequently updated:
  - ICMP Ping data scans of IPv4 /0
  - IPv4 and IPv6 RDNS data
  - Forward DNS data (Looking what A or AAAA records point to a prefix)
- Peering IXP data is provided:
  - Like what people are sending to Route Servers
  - What vendors they are running on the exchange
  - If they are doing (very) remote peering on the exchange

Making the bgp.tools I want possible

## Challenges running bgp.tools

- Getting low latency and accurate BGP data to use
- Building a scalable system to avoid being picky on feeds
- Collecting relevant data
- Not going bankrupt

## The inner runnings of bgp.tools

Most critically BGP path data

```
# birdc s ro 80.80.80.0/24 all
BIRD 2.0.7 ready.
Table master4:
80.80.80.0/24 unicast [transit4 velox 2 2023-09-19] * (100) [AS60679i]
    via 193.35.59.46 on eno1.601
    Type: BGP univ
    BGP.origin: IGP
    BGP.as path: 3170 6461 7385 30247 60679
    BGP.next hop: 193.35.59.46
    BGP.local pref: 10
    BGP.community: (60945,0) (60945,5459) (65532,400)
```

## Standard BGP data sources

## Using public data sources

- RIPE RIS (RIS) and RouteViews (RV) export MRT dumps
  - MRT Dumps come in two types, a RIB (aka a full table dump) and "messages" (a copy of all BGP messages in the last 15 mins
  - Table dumps are done 4 to 8 hours, message files are provided every 15 mins
    - (Most of the time)

- Bgp.tools started in 2018 by using RIS and RV MRT table dumps.
  - o I quickly learned the quirks of using RIS and RV as "Production" data sources...

## RIS and RV quirks to control for

#### Table dumps

- Only show up every 4 8 hours
- Make it hard to remove individual sessions that are known to be bad
- Message dumps (never used by bgp.tools production in the end)
  - If a message file never shows up, you have to wait until the next dump file (4 8 hours) before becoming reliability in sync again.
  - People "UPDATE flood" collectors by mistake, making these archives sometimes huge and a pain to decode

#### General

- Huge bias to AS6939 (HE)
- They are on almost all of the large IXPs, and provide you 180k+ of peered v4 routes that will likely be preferred over transit, hiding transit paths from the collector

## Going beyond RIS and RV

- Eventually in 2021 after a number of issues with MRT files from RV and RIS bgp.tools started to build its own route collector
  - Issues like moderation, bad data, stuck routes
  - Reducing site data latency to be less than 8 hours behind with message files would be the same effort as building my own collector
- Decided that a multihop eBGP only collector was viable to start with

- It was clear that no "normal" BGPd was going to work for the scale I wanted, a custom suite of bgp software needed to be written
- Bootstrapped with a live copy of the NLNOG Ring route collector: <a href="https://lg.ring.nlnog.net/">https://lg.ring.nlnog.net/</a>

A purpose built "bgpd" for the exact use case that bgp.tools wants

- Each BGP Session is in it's own process
  - PIDs crash independently, memory per process is manageable
  - Upgrades can happen on a single BGP session at a time
  - Entire system scales to as many CPU cores as your system has
- No need to implement router-useful functions
  - Bgp.tools is only interested in getting BGP paths and AS summary computations as fast as possible
- Feature implementation moves to the bgpd, not a polling worker over N many sessions

```

```

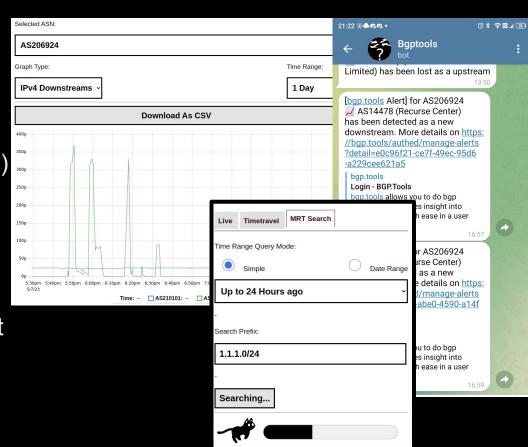

- Bgp.tools currently sits at 1360~ BGP sessions
  - o 750∼ full IPv4 tables
  - 1210~ full IPv6 tables
  - o 1,000,000,000+ BGP Paths stored in RAM
- Hardware is modest, entire site operates inside ¼ cab with room to spare
  - 512G DDR4 per machine
  - 32~ cores per machine
  - 3 active machines right now, 3 available to turn on (when I want to pay for power)
- Running bgp.tools on a cloud provider would cost around \$12k USD a month
  - In reality it costs 15-20x less than that in colo

## Challenges running bgp.tools

- Getting low latency and accurate BGP data to use
- Building a scalable system to avoid being picky on feeds
- Collecting relevant data
- Not going bankrupt

- The site is funded by offering rapid BGP/IRR/RPKI monitoring (and historical searching on your own feeds)
- The neo-bgp architecture allows me to send alerts as fast as I can get data for them!
- There are a bunch of other paid user features, but I don't want to turn this into a major sales pitch

## Challenges running bgp.tools

- Getting low latency and accurate BGP data to use
- Building a scalable system to avoid being picky on feeds
- Collecting relevant data
- Not going bankrupt

Internet Exchange Route Collection

## Status Quo

 Most of the RIS / RouteViews collectors live on internet exchanges

 This has some advantages, as networks can peer with route collectors over shared L2 fabrics

Name	Physical Location	Type	Scope	Raw Data
RRC00	Amsterdam, NL	multihop	global	data⊠
RRC01	London, GB	IXP	LINX, LONAP	data⊠
RRC03	Amsterdam, NL	IXP	AMS-IX, NL-IX	data⊠
RRC04	Geneva, CH	IXP	CIXP	data⊡
RRC05	Vienna, AT	IXP	VIXP	data⊠
RRC06	Otemachi, JP	IXP	DIX-IE	data⊠
RRC07	Stockholm, SE	IXP	Netnod	data⊠
RRC10	Milan, IT	IXP	MIX	data⊠
RRC11	New York, NY, US	IXP	NYIIX	data⊠
RRC12	Frankfurt, DE	IXP	DE-CIX	data⊠
RRC13	Moscow, RU	IXP	MSK-IX	data⊠
RRC14	Palo Alto, CA, US	IXP	PAIX	data⊠
RRC15	Sao Paolo, BR	IXP	PTTMetro-SP	data⊠
RRC16	Miami, FL, US	IXP	Equinix Miami	data⊠
RRC18	Barcelona, ES	IXP	CATNIX	data⊠
RRC19	Johannesburg, ZA	IXP	NAP Africa JB	data⊠

## Issues with IXP route collection

- RIPE RIS has ~1535 BGP sessions online,
  - But 372 / 407 Full IPv4/IPv6 tables
  - (by their own calculations)
  - 372 + 407 = 779. Far off the 1535 total session count
  - Many people peer with RIS, but only send their customer routes
    - This is not entirely helpful...

## Other problems with IXP Route Collection

- Really expensive if you don't have friends
  - IXP Membership fees + XC fees + colo fees
  - IXP membership alone can be more than the last two
  - https://peering.exposed

 Even if the IXP can be done for free, the power to power the machine or transport to another place is likely also non trivially expensive

## Getting creative to solve for XC Fees / Colo

 What is the cheapest, smallest, most insane thing we could ship to a willing IXP?

## Getting creative to solve for XC Fees / Colo

 What is the cheapest, smallest, most insane thing we could ship to a willing IXP?

## Getting creative to solve for XC Fees / Colo

 What is the cheapest, smallest, most insane thing we could ship to a willing IXP?

- No XC, The switch is the power supply, you can hitch backhaul either via someone friendly on the IXP, or relaying via a VPS or something
- Cheap, Around 150 USD all in
  - Single core ARMv7, with 512M of RAM running Debian Jessie
  - **Completely crazy**. Everyone is going to look at you like you lost the plot!
  - Made by a Russian/Dubai company since the Russian Invasion of Ukraine

https://blog.benjojo.co.uk/post/smart-sfp-linux-inside

## Creative solutions are available

## Creative solutions are available

- Runs a 400Mhz~ 32bit MIPS core, 32MB of RAM
- The constrained RAM and MIPS CPU µArch makes this a challenge to program for
- Thankfully Zig lang has a mostly working MIPS target!
- To use as a generic "Linux box" you must perform some software changes
- Vendor has been really keen and helpful with modding these

 Similar tech is available via Huawei/Nokia/FS.COM (they share a chipset and design) for 80 USD~ per optic

## The actual preference tree

- Some IXPs have VM infrastructure on the exchange that is easy to use, bgp.tools can run a relay in 128MB of RAM and very low CPU requirements
- 2. Those magic Linux optics are easy and convenient to ship around
  - But are mildly scary for some, also 1G only, and IXPs are sunsetting 1G ports
- 3. At worst I can ship physical 1U hardware around
  - o Ideally want to try and land as many IXPs in a single machine to conserve funds

## All sessions lead back to London

 You have have noticed it isn't really possible to store a modern full internet table on 32MB of RAM.

 Instead of storing sessions locally, the local collector will "rehost" the BGP session back in London where all of the website infrastructure is.

 This is because with how bgp.tools is designed, all BGP data has to be within 3ms~ of the web server to ensure a enjoyable experience

## **Current Deployments**

- > JINX, DINX, CINX, NMBINX
- **■** ONIX, QIX
- NL-IX, INTERIX, Frys-IX
- BCIX, Stuttgart-IX, DE-CIX (FRA,DUS,LEJ,HAM,MUC)
- RomandIX
- **LONAP**
- PIT-IX, DE-CIX { New York, Dallas, Chicago, Richmond, Phoenix }
- BIX.BG
- DE-CIX (Madrid, Barcelona)
- DE-CIX Marseille
- DE-CIX Palermo
- LU-CIX
- SOX Serbia
- MSK-IX Moscow
- DE-CIX Istanbul
- DE-CIX Lisbon

Bgp.tools is always looking for better visibility into IXPs!

Do you run a IXP not listed here? admin@bgp.tools

## Challenges running bgp.tools

- Getting low latency and accurate BGP data to use
- Building a scalable system to avoid being picky on feeds
- Collecting relevant data
- Not going bankrupt

## Setting up feeds is easy

Go to (PeeringDB SSO is supported): <a href="https://bqp.tools/kb/setup-sessions">https://bqp.tools/kb/setup-sessions</a>

You can **instantly** setup sessions to bgp.tools. Where you **should** export a full table. You can peer using eBGP Multihop or via a IXP collector where available

Export to 3rd parties/Looking Glass visibility is entirely optional!

Description 1	for Router	Session: (max 16	criars)				
LHR01							
Select the A and Private			for you. We will	only accept	AS212232 (b	<u>gp.tools),</u> AS206924	AS212232
